

MIFARE

DOM Protector® Mifare and DOM AccessManager

New Family Member: DOM focuses on innovative Mifare technology

The introduction of the contactless chip card technology Mifare is eagerly anticipated at DOM: with this technology the company extends its portfolio of electronic master key systems by the frequency 13,56 MHz – in addition to the existing 125 kHz technology.

From 2011 onwards the DOM Access Manager and the DOM Protector® will be equipped with Mifare. The DOM Protector® will have an optimized energy management and allow a simplified assembly. Furthermore the Mifare technology offers further options regarding virtual networks. Furthermore it will be possible to create highly flexible access control models with many possibilities for the awarding of

temporary authorizations and special functions. The wallreader DOM Access Manager will also get new additional functions: thanks to the integrated Ethernet-interface it can be run online without any further hardware. For offline applications the programming can be done comfortably via radio.

Furthermore DOM will offer a special software called DOM Genius for the Mifare products. Besides the browser surface it will have additional functions, e. g. a flexible authorization model and a web service as an interface to other systems. DOM Genius can be used for the whole spectrum of mobile programming with laptops/netbooks to client-server-installations.
